Gaston Cremieux, 91057 Evry cedex, FRANCE
PCR was performed on DNA from transforments of Arabidopsis thaliana
pCR was performed on DNA from transforment (s) resulting from
the PCR were directly sequence from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
http://dbagap.versailles.inra.fr/publiclines/. This sequence has
been generated in the framework of the French plant genomics
program 'Genoplante-info.infobiogen.fr).

Cronin MT, Shak S, Baselga J;	2004-420643/39.			analysis	gene e.g., CD44v3.	400000000000000000000000000000000000000	Claim 55; SEQ ID NO 84; 113pp; English.	ion relates to a novel method concerning prognostic markers	with EGFR (epidermal growth factor receptor) positive cancer.	/, it refers to a gene expression profitting method that can rediction as to whether a natient is likely to respond well to	ith an EGFR inhibitor. The present invention describes the	analysis of the expression level of the RNA transcript of at	RRII7, LAMC2 or their products thereof. It further provides a CDNA	microarray containing named genes that represent prognostic transcripts	which are useful for determining whether a patient diagnosed with an EGFR -expressing head or neck cancer or colon cancer exhibits elevated or	decreased expression levels of these genes compared to normal. As such,

R1 and R2 both bind to (1) and have formulae 5'-A-B-C-3' (R1) 5'-D-F-7' (R2) where: A and F c (1) and have formulae 5'-A-B-C-3' (R1) 5'-D-F-7' (R2) where: A and F c RNA segment of 10 to 100000 nucleotides (nt) that together are replicated by RNA replicase; B and E = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of RNA segments of 1 to 10000 nt which can be ligated together. Ligation of to (1). Replication of R3 by RNA replicase indicates presence of (1). Also described are: (1) method for detecting (I) using R1 and R2; (2) kit for this process containing R1, R2, pigase and an amplification system; and (3) method for making R1 and R2 by transcription from appropriate DNA. R1 and R2 are used to detect and quantify telomerase, particularly for diagnosis of cancer and for detection of metastases. R1 and R2 provide an assay that does not require expensive equipment or highly trained personnel, and is suitable for automation. The present sequence represents an oligonucleotide used in the exemplification of the present
                                                                                                                                                 ö
these methods are also useful for prognosing or predicting the likelihood of cancer-attributable death or progression, including recurrence and metastatic spread of a neoplastic disease, as well as drug resistance. This polynuclectide sequence is a human PCR amplicon DNA sequence used a prognostic cancer marker, given in an exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a pair of RNA molecules (R1, R2) for detecting a first subunit protein (1) of telomerase. R1 and R2 both bind to (1) and have formulae 5'-A-B-C-3' (R1) 5'-D-E-F-3' (R2) where: A and F = RNA segment of 10 to 100000 mucleotides (nt) that together are replicated by RNA replicase; B and E = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound to (1). Replication of R3 by RNA replicase indicates presence of (1). Also described are: (1) method for detecting (1) using R1 and R2; (2) kit for this process containing R1, R2, ligase and an amplification system; and (3) method for making R1 and R2 by transcription from appropriate DNA. R1 and R2 are used to detect and quantify telomerase, particularly for diagnosis of cancer and for detection of metastases. R1 and R2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     provide an assay that does not require expensive equipment or highly trained personnel, and is suitable for automation. The present sequence represents an oligonucleotide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pair of RNA molecules for detecting telomerase, useful for diagnosis of cancer or metastases, can be ligated when bound to telomerase subunit

The specification describes a first RNA (RNA1) and a second RNA (RNA2) for use in binding an RNA-binding protein (RBP) having protein and RNA components. RNA1 has the formula 5'-A-B-C-3', where A is section having (10-100,000 nucleotides and is can be received by an RNA replicase and with another DNA sequence, F, being replicated; B is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the RBP and which can bind to the protein component; C is section having about 1-20 nucleotides and which can be ligated to D of the second RNA molecule. RNA2 has the formula 5'-D-E-F-3', where D is section having 1-C on nucleotides and which can be ligated to C; E is section having 1-C and which can bind to the protein component; F is section having 10-100,000 nucleotides which have affinity to second consensus sequence of the RBP and which can bind to the protein component; F is section having 10-100,000 nucleotides which and RNA2 are capable of forming a third RNA (RNA3) of formula 5'A-B-C-D-E-F-3'. The method is useful for the identification of confidential calfinity to anino and characterization of RNA sequences having specific affinity to anino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
New ribonucleic acids useful for identifying naturally occurring RNA sequences having affinity for RNA-binding protein having protein and RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid consensus sequences of RBPs, and to RNAS. AAR24815-16 were used to produce a double-stranded RNA1, comprising the Y-1 domain of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 GGGTTGCGGAGGCTGGGAGGGGTGGTGGCCATTTTTGTCTAACCCTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to promoter regions from mouse and human telomerase

RNA (TR) component genes. The TR gene promoter can be linked to a

RNA (TR) component genes. The TR gene promoter can be linked to a

Cancer, especially neoplasias. The telomerase is necessary for the relation of cancer, especially neoplasias. The telomerase is necessary for the currestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression in cancer. Bubstances,

Con upregulation of telomerase expression in cancer. Substances,

clantified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These obstances, e.g. antisense oligonucleotides, transcription factors,

Competide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors

Competide can be used to convert a promoter and a viral thymidine kinase gene can be used to convert a promoter and a viral thymidine compasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences PAZ07324-332 and AAZ0032-340 represent constructs

With hTR promoter sequence element mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The invention relates to promoter regions from mouse and human telomerase
RNA (TR) component genes. The TR gene promoter can be linked to a
Carcer, especially a gene encoding a cytotoxin, for therapy of
Carcer, especially neoplasias. The telomerase is necessary for the
Unrestricted proliferative capacity of many human cancers. Mutation or
dysregulation of the telomerase expression pathway may cause reactivation
Cor upregulation of telomerase expression in cancer. Substances,
conspiratores, e.g. antisense oligonucleotides, transcription from the TR
conspiratores, e.g. antisense oligonucleotides, transcription factors,
peptide nucleic acids and factors that disrupt signal transduction, are
useful for cancer therapy. In particular, gene therapy vectors
cospecially proffed-coddupp) comprising the promoter and a viral thymidine
kinase gene can be used to convert a productug, e.g. gancyclovir, so that
neoplasia can be controlled or treated. Direct down regulation of
telomerase RNA gene through manipulation of transcription factors may be
effective anticancer therapy and the cloning of the hTR gene promoter
allows the analysis of therapeutic molecules which modulate hTR promoter
allows the analysis of therapeutic molecules which modulate hTR promoter
activity.
                                                                                                                                                                                                                                                                                                                                                                                                                Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Telomerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; hTR; gene therapy; thymidine kinase gene; anticancer therapy; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                            RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligomucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (specially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be used to convert a prodrug, e.g. gancyclovir, so that the neoplasia can be used to convert a prodrug, e.g. gancyclovir, so that the neoplasia can be through manipulation of transcription factors may be telective anticancer therapy and the cloning of the hrR gene promoter allows the analysis of therapeutic molecules which modulate hrR promoter allows the analysis of therapeutic molecules which modulate hrR promoter activity. Sequences AAZ07324-332 and AAZ00332-340 represent constructs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·.

LIVE INTURLION TEALEURS LO PERONCER FEGIONS FLOW mouse and numer LEGIONGEAGE

RNA (TR) component genes. The TR gene promoter can be linked to a carcer, especially neoplasias. The telomerase is necessary for the cancer, especially neoplasias. The telomerase is necessary for the currestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression pathway may cause reactivation or dysregulation of the telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR came promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligomucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine cusquil for cancer therapy in particular, gene therapy vectors may be effective anticancer therapy and the clonding of the hTR gene promoter callows the analysis of therapeutic molecules which modulate hTR promoter callows the analysis of therapeutic molecules which modulate hTR promoter callows the hTR promoter sequence element mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                          The invention relates to promoter regions from mouse and human telomerase
RNA (TR) component genes. The TR gene promoter can be linked to a
Reterologous gene, especially a gene encoding a cytotoxin, for therapy of
cancer, especially neoplasias. The telomerase is necessary for the
cancer, especially neoplasias. The telomerase is necessary for the
currestricted proliferative capacity of many human cancers. Mutation or
dysregulation of the telomerase repression pathway may cause reactivation
of upregulation of telomerase expression in cancer. Substances,
clantified in the methods, can be used to block transcription from the TR
gene promoter through interaction of the 5' regulatory sequences. These
substances, e.g. antisense oligonucleotides, transcription factors,
peptide nucleic acids and factors that disrupt signal transduction, are
useful for cancer therapy. In particular, gene therapy vectors
cuseful for cancer therapy. In particular, gene therapy vectors
chepcially pGF2-codAupp) comprising the promoter and a viral thymidine
kinase gene can be used to convert a producy, e.g. gancyclovir, so that
neoplasia can be controlled or treated. Direct down-regulation of
telomerase RNA gene through manipulation of transcription factors may be
effective anticancer therapy and the cloning of the hTR gene promoter
allows the analysis of therapeutic molecules which modulate hTR promoter
activity. Sequences AAZ07324-332 and AAZ00332-340 represent constructs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of

cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, in dentified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a product down-regulation of the neoplasia can be used to convert a product down-regulation of telomerase RNA gene through manipulation of transcription factors may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR
                                                                                                                                                                                                                                                                                                            effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07696-321 represent PCR primers used in cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse and human telomerase RNA gene promoters, useful for tumor specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to promoter regions from mouse and human telomerase heterologous gene, especially a gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These betild mutaleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine
                   substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors are (especially pGT62-codAup) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AZGV769-321 represent PCR primers used in cloning and mutagenisis of human TR gene (hTR) promoter region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                             Gaps

The oligomuclectide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods involve the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing positive charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for
kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AA207669-321 represent PCR primers used in cloning and mutagenisis of human TR gene (hTR) promoter region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; telomerase RNA component; anticancer therapy; purification; assay; vaccine; cancer; antisense oligonuclectide; ss.

                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a telomerase target sequence. The invention relates to an antisense oligomucleotide used as a control sequence alongside a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase cativity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invention sequence contained within the RNA component of the enzyme. The invention catalates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other diseases complexics antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization
                                                                                                                            ö
biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.

The PNAs are useful as probes to detect the RNA component of
probes to detect or quantitate polynucleotides having a human telomerase RNA (hTR) sequence. PNA probes are also used for forensic identification of individuals. e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or
